

head

index = 3

val = 7

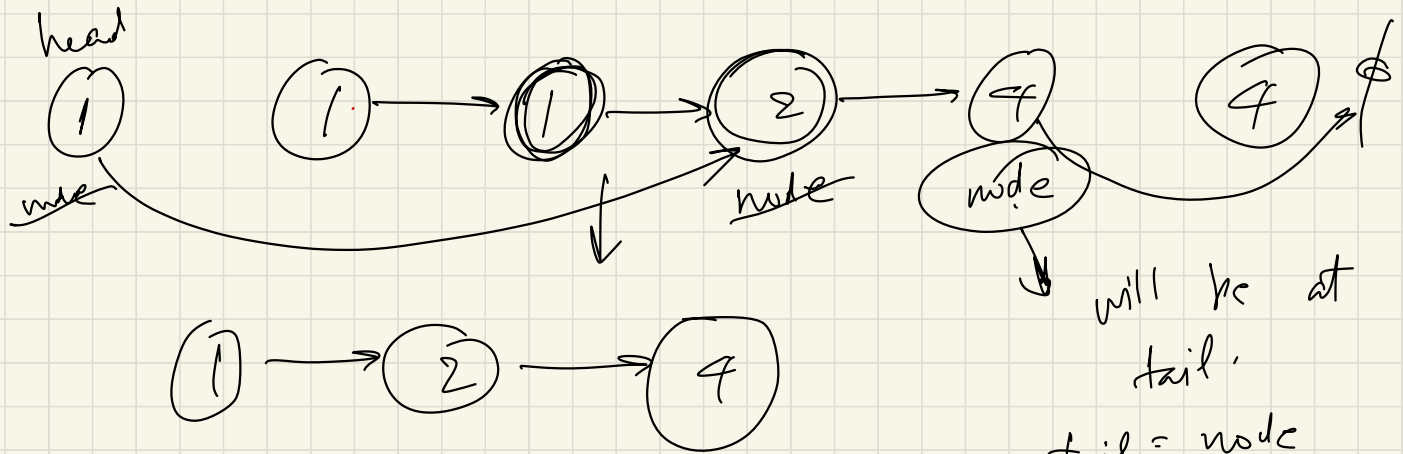

(3, val)

① Void return type & make changes in LL

② node return type that returns the list node to change the structure.

Q:

will be at tail.
tail = node
tail.next = ϕ

Q

list 1 :

list 2 :

ans :

fast & slow pointer:

★ Cycle detection

★ finding a node in cycle, (if)

2 possibilities:

① Find length of cycle ✓

② move S ahead by length of cycle times.

③ move S & J one by one, it will meet at start.

Q. Google Question

Ex:

12 \Rightarrow

$$1^2 + 2^2 = 1 + 4 = 5$$

$$5^2 = 25$$

$$2^2 + 5^2 = 4 + 25 = 29$$

$$2^2 + 5^2 = 4 + 81 = 85$$

$$\boxed{8^2 + 9^2} = 8^2 + 9^2 = 64 + 81 = 145$$

$$1^2 + 4^2 + 5^2 = 42$$

$$4^2 + 1^2 = 20$$

$$2^2 + 0 = 4$$

$$4^2 = 16$$

$$1^2 + 6^2 = 37$$

$$3^2 + 7^2 = 9 + 49 = 58$$

$$5^2 + 8^2 = 25 + 64 = 89$$

$$8^2 + 9^2 = \dots$$

Q: middle

BS
Case 1

head = 3

f.next = s.next
s.next = f

f.next = s
f.next = s.next
s.next = f

Case 2

f.next = s
tail = f
f.next = ϕ
s.next = tail

while prev == null:
prev.next = prev

prev = prev

prev = next

next = next.next // note: pointer check

In the end:

break = prev.

Q

Reverse a LL - II

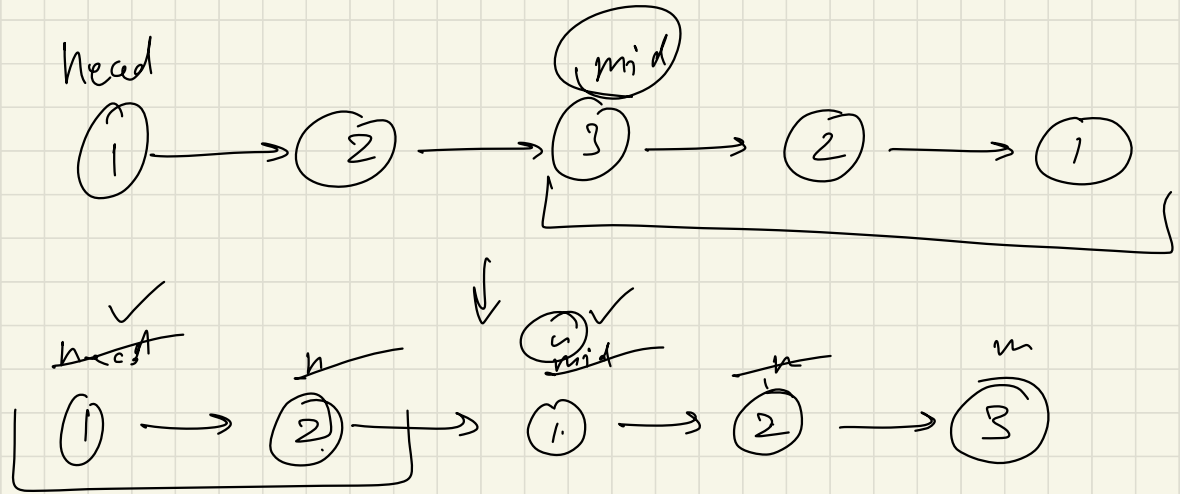

l = 2
r = 4
next

last.next = null / if last = null:
head = null

Q:

re-reverse the second half.

Q: fc-order list:

✓ temp = hf.next
hf.next = hs

hf = temp

✓ temp = hs.next

hs.next = hf

hs = temp

Q:

Rev every k-node:-

k = 3

run a for loop k times till $curr \neq \phi$

$new_last \cdot next = current$

Q:
k=3

① original
last node, next original head

② new head = start of sub list

③ new tail = node before ↓

$head = newlast.next$
 $newlast.next = \phi$

$l = 6$

$rotations = k \% l$
